Regional Energy Market Model (REMM)

Dipl.-Wirtsch.-Ing. (FH) Jens Maiwald – jens.maiwald@hszg.de

FORSCHEN_OHNE_GRENZEN

ABM4Energy - Agent-Based Modeling for Energy Economics and Energy Policy, 22.03.2024

Agenda

- 1 Motivation
- 2 Basic principles of REMM
- 3 Selected insights of scenarios and results
- 4 Conclusion

Agenda

- 1 Motivation
- 2 Basic principles of REMM
- 3 Selected insights of scenarios and results
- 4 Conclusion

Motivation in a nutshell

„The energy transition takes place on local levels.“

[Agora 2017]

... but is there any additional value of regional (green) electricity marketing for energy economy and society?

Regional energy markets are not understood as self-sufficient isolated markets, but rather as integrated units in an interregional wholesale energy market.

Agenda

- 1 Motivation
- 2 Basic principles of REMM
- 3 Selected insights of scenarios and results
- 4 Conclusion

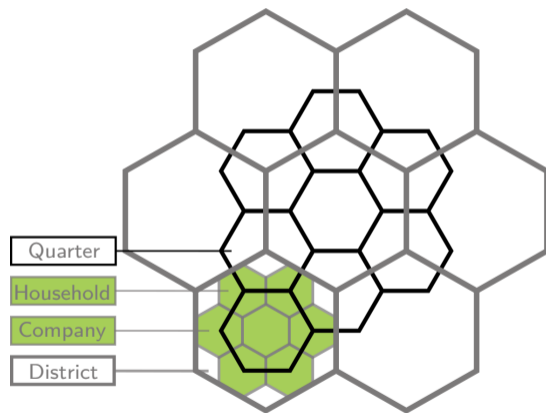

It's all about entities and their behaviour

ABM

Portray an economic system in which orderly behaviour emerges as a result of interaction between heterogeneous agents, none of whom has any understanding of how the overall system works.

Peer-to-peer trading in cellular structures

Cellular approach

Achieving equilibrium
between electricity
generation and
consumption at the lowest
possible level.

How to (re-)build consumer behaviour

Reality

- ▶ Electricity = homogeneous commodity (physically)
- ▶ Distinctions based on
 - ⇒ Energy source
 - ⇒ Place of generation

Preferences in REMM

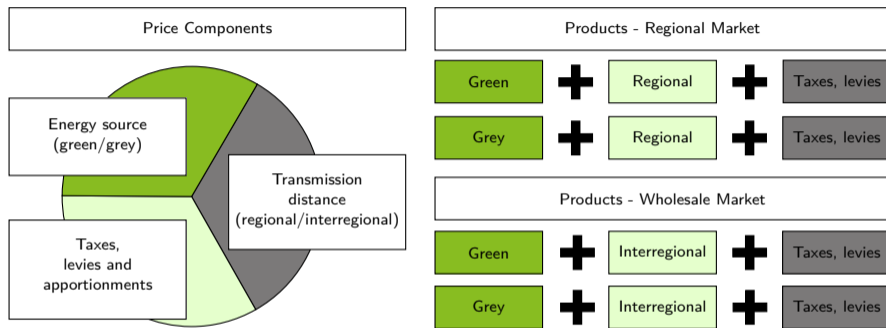

- ▶ Environmental awareness $\rightarrow e \in]0, 1]$
- ▶ Regional awareness $\rightarrow l \in]0, 1]$
- ▶ Price/cost sensitivity $\rightarrow c \in]0, 1]$
(Indicator: Income/Revenue)

Values for prices and preferences are used to calculate utility values and to create **individual agent behaviour**.

REMM can also display decision inertia

- ▶ Preference status quo
- ▶ Lack of interest, delayed perception

Electricity products and price components lead into two-stage decision process

Stage I: energy source

$$p_{source} = \begin{cases} p_{base} & : \text{Grey} \\ p_{base} + p_{green} & : \text{Green} \end{cases}$$

Stage II: transmission distance

$$p_{reg} \Rightarrow \text{regional purchase}$$

$$p_{trans} \Rightarrow \text{interregional purchase}$$

Stage I: intrinsic value vs. (negative) value of (higher) costs

GREEN

Intrinsic utility value

$$u_{intr,i,t} = e_i \cdot \sqrt{p_{green,t}} \cdot c_i$$

Utility value of (higher) costs

$$u_{cost,i,t} = c_i^2 \cdot (p_{base} + p_{green,t})$$

Overall utility function ($U = u_{intr} - u_{cost}$)

$$U_{green,i,t} = e_i \cdot \sqrt{p_{green,t}} \cdot c_i - c_i^2 \cdot (p_{base} + p_{green,t})$$

GREY

$$u_{intr,i,t} = 0$$

$$u_{cost,i,t} = c_i^2 \cdot p_{base}$$

$$U_{grey,i,t} = 0 - c_i^2 \cdot p_{base}$$

Stage II: intrinsic value vs. (negative) value of (higher) costs

REGIONAL

Intrinsic utility value

$$u_{intr,i,t} = I_i^2 \cdot \sqrt{p_{reg}} \cdot c_i$$

Utility value of (higher) costs

$$u_{cost,i,t} = c_i^2 \cdot p_{reg}$$

Overall utility function ($U = u_{intr} - u_{cost}$)

$$U_{reg,i,t} = I_i^2 \cdot \sqrt{p_{reg}} \cdot c_i - c_i^2 \cdot p_{reg}$$

INTERREGIONAL

$$u_{intr,i,t} = 0$$

$$u_{cost,i,t} = c_i^2 \cdot p_{trans}$$

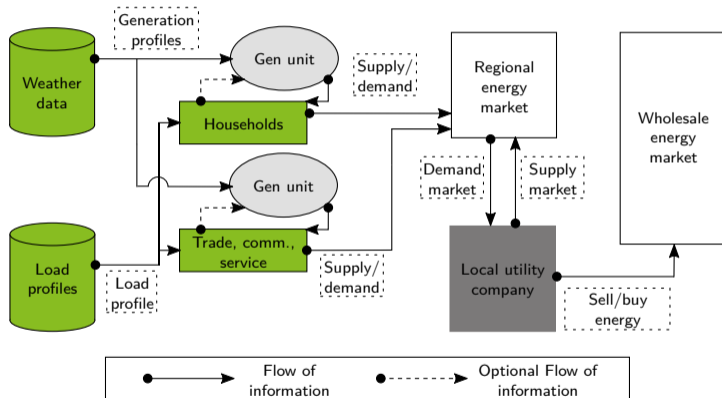

$$U_{trans,i,t} = 0 - c_i^2 \cdot p_{trans}$$

Agenda

- 1 Motivation
- 2 Basic principles of REMM
- 3 Selected insights of scenarios and results
- 4 Conclusion

Simulated supply system

Characteristics

- ▶ Distribution grid level
- ▶ 15.400 household agents
- ▶ 1.600 TCS-companies
- ▶ (100 "bigger" companies)
- ▶ Database - load profiles *H0 & G0 (& measured)*
- ▶ Database - weather data *TRY 2015*

Demand for 'Green Regional' increases within flexible pricing mechanisms

Scenario

- ▶ Fix price vs. flex price
- ▶ PHHs, BSLs, BMLs
- ▶ Green and grey generation
- ▶ Share PV: 5 % | 15 %
- ▶ Share CHP: 5 % | 15 %
⇒ Biogas: 33 % | 50 %

Demand \neq Consumption

... and also: decreasing demand for 'Grey Regional'

Scenario

- ▶ Fix price vs. flex price
- ▶ PHHs, BSLs (no BMLs)
- ▶ Green and grey generation
- ▶ Share PV: 5 % | 15 %
- ▶ Share CHP: 5 % | 15 %
⇒ Biogas: 33 % | 50 %

Demand \neq Consumption

Hochschule

TEAM INFORMATIK MANAGEMENT SYSTEME
WIRTSCHAFTS UNIVERSITÄT ZITTAU

Demand for regional products cannot be increased infinitely

(a) 10 % PV

(b) 20 % PV

(c) 30 % PV

(d) 50 % PV

Scenario

- ▶ Fix price vs. flex price
- ▶ PHHs, BSLs (no BMLs)
- ▶ Only green generation
- ▶ Solely PV scenario
⇒ 10 | 20 | 30 | 50 %

$$\begin{aligned} &\text{Residual sales volume} \\ &= \\ &\text{Sales Volume} - \text{Demand} \end{aligned}$$

Diversified generation scenarios can partly create net-zero situations at the market

(a) 10 % PV, 5 % CHP

(b) 20 % PV, 10 % CHP

(c) 30 % PV, 15 % CHP

(d) 50 % PV, 25 % CHP

Scenario

- ▶ Fix price vs. flex price
- ▶ PHHs, BSLs (no BMLs)
- ▶ Only green generation
- ▶ PV & CHP scenario
 - ⇒ PV: 10 | 20 | 30 | 50 %
 - ⇒ CHP: 5 | 10 | 15 | 25 %

$$\begin{aligned} &\text{Residual sales volume} \\ &= \\ &\text{Sales Volume} - \text{Demand} \end{aligned}$$

Agenda

- 1 Motivation
- 2 Basic principles of REMM
- 3 Selected insights of scenarios and results
- 4 Conclusion

Under the bottom line ...

- ▶ REMM accurately maps markets for distribution grids
- ▶ Increasing shares of prosumers/RES reduce overall demand and thus the leverage for incentives
- ▶ Demand can not be flexibilized infinitely
- ▶ “Flex price“ scenario impacts the demand in a positive manner but only in moderate expansion scenarios
- ▶ Evenly distributed generation shows more positive effects to work with financial incentives
- ▶ Discounts in the regional grid fee only appear to have an influence on the demand for “Grey Regional“

Financial incentives have the potential to reduce the effort required to achieve equilibrium between generation and consumption on a regional level. However, relying solely on financial incentives is insufficient for achieving this balance. Therefore, we emphasize the importance of exploring opportunities through the interplay of financial incentive mechanisms and technical possibilities.

„Essentially, all models are wrong, but some are useful.“

George Box
(1919-2013)
